### Control structures

C++ Lecture 3

Nick Matthews Adam Kohl

#### **Motivation**

- Need the ability to add logic to our programs
- Math is much easier with C++
- Error checking
  - Changing the flow of the program
  - Mainly used to check if a certain part of the code should be executed

#### If statements

- Allows for changing code flow depending on conditions
- If (condition is true) { execute something } else {execute something else}
- Elseif

```
if (bank_account < 0){
    cout << "Huh?" << endl;
}
elseif (bank_account > 10000000){
    cout << "WHAAAAAAAAAAT?" << endl;
}
else{
    cout << "Welcome to the 99%" << endl;
}</pre>
```

#### If statements

- Nesting means to put similar control structures within each other
- Helps in separating logic and making code more readable

```
if (bank_account > 0){
    if (bank_account > 1000000){
        cout << "WHAAAAAAAAAT?" << endl;
    }
    else{
        cout << "Welcome to the 99%" << endl;
    }
}
else{
    cout << "Huh?" << endl;
}</pre>
```

## Mini Task

Compile the code given in control structures code.cpp and make sure that it runs

If there are any errors, how would you fix it?

#### Switch – case statements

• Sometimes you can go crazy with if statements

```
srand(time(NULL));
int die = rand() \% 6 + 1;
if (die == 1){
    cout << "Hello I'm Mercury" << endl;</pre>
if (die == 2){
    cout << "Hello I'm Venus" << endl;</pre>
if (die == 3){
    cout << "Hello I'm Earth" << endl;</pre>
if (die == 4){
     cout << "Hello I'm Mars" << endl;</pre>
if (die == 5){
    cout << "Hello I'm Jupiter" << endl;</pre>
if (die == 6){
    cout << "Hello I'm Saturn" << endl;</pre>
```

```
switch (die){
case(1):
    cout << "Hello I'm Mercury" << endl;</pre>
    break:
case(2):
    cout << "Hello I'm Venus" << endl;</pre>
    break;
case(3):
    cout << "Hello I'm Earth" << endl;</pre>
    break;
case(4) :
    cout << "Hello I'm Mars" << endl;</pre>
    break;
case(5):
    cout << "Hello I'm Jupiter" << endl;</pre>
    break:
case(6):
    cout << "Hello I'm Saturn" << endl;</pre>
    break;
default:
    cout << "Hello I'm want to be Pluto" << endl;</pre>
```

#### Switch – case statements

```
switch (die)
case(1)
    cout << "Hello I'm Mercury" << endl;</pre>
    break;
case(2):
    cout << "Hello I'm Venus" << endl;</pre>
    break;
case(3):
    cout << "Hello I'm Earth" << endl;</pre>
    break;
case(4):
    cout << "Hello I'm Mars" << endl;</pre>
    break:
case(5):
    cout << "Hello I'm Jupiter" << endl;</pre>
    break;
case(6) :
    cout << "Hello I'm Saturn" << endl;</pre>
    break;
default:
    cout << "Hello I'm want to be Pluto" << endl;</pre>
```

Works with char, int, float, double NOT string

Need to put a break statement to avoid it bleeding into other statements

Goes to this line if none of the cases match

## Mini Task

Convert the if statements to switch case statements

### Loops

- 3 main types
  - While
  - Do while
  - For loop
- You can repeat blocks of code based on certain conditions

### While loop

While (condition is true) { execute something }

• Will keep running till the condition is false

```
cout << "Countdown" << endl;</pre>
int count = 10;
while (count > 0){
    cout << count << endl;</pre>
    count = count - 1;
    Sleep(1000);
```

#### Do while

While loop backwards

do {execute something} while (condition is true);

Will execute the body of the loop at least once

```
cout << "Countdown" << endl;
int count = 10;
do{
    cout << count << endl;
    count = count - 1;
    Sleep(1000);
} while (count > 0);
```

### For loop

• Convenience function that does a lot for us

```
for (initialize loop variable; check condition is true; increment loop variable) { execute something }
```

C++ takes care to execute everything properly and in order

```
for (int count = 10; count > 0; count = count - 1){
   //Do something
   cout << count << endl;
}</pre>
```

### For loop

```
for (int count = 10; count > 0; count = count - 1){
   //Do something
   cout << count << endl;
}</pre>
```

Initialization of loop variable run once only before entering the loop Condition check run every time before entering the loop

Run every time after finishing the loop

## Mini Task

Make modifications to while loop

Convert to do while

Convert to for loop

# Questions?

### Assignment

- Do the control structures assignment.cpp
- o If you finish quickly enough, do the advanced one
